& RECONS Team

Solar Neighborhood

- ❖ Fundamental volume-limited sample
 - Eventually census stars within 25 pc
- ❖ Know 49 systems within 5 pc
 - Implies 392 systems within 10 pc
 - Only 249 systems known within 10 pc
 - 143 missing systems?
 - How do they fit into the sample?
 - What do they look like?
 - Do they host companions, esp. planets?

CTIOPI Subsample

❖ Select candidates with

- Declination $\leq 0^\circ$
- Photometric or spectroscopic distance ≤ 15 pc
- $V_J \leq 15$ mag or $J \leq 13.1$ mag

❖ 31 possible nearby stars

- Estimated distances 6—15 pc
- Brightest $V_J=11.61$ mag
- Earliest spectral type M3, nearly half without

CTIOPI Astrometric Results

❖ 28 probable members of the solar neighborhood

- 3 stars within 10 pc

LP 876-10	7.8	± 0.1 pc
-----------	-----	--------------

LP 991-84	8.4	± 0.2 pc
-----------	-----	--------------

LHS 6167	9.6	± 0.2 pc
----------	-----	--------------

- LHS 2880 9.8 ± 0.7 pc* $\rightarrow 29 \pm 1$ pc

❖ 5 high proper motion stars, $\mu > 0.5''/\text{yr}$

2MASS J02511490-0352459 $2.154 \pm 0.003''/\text{yr}$

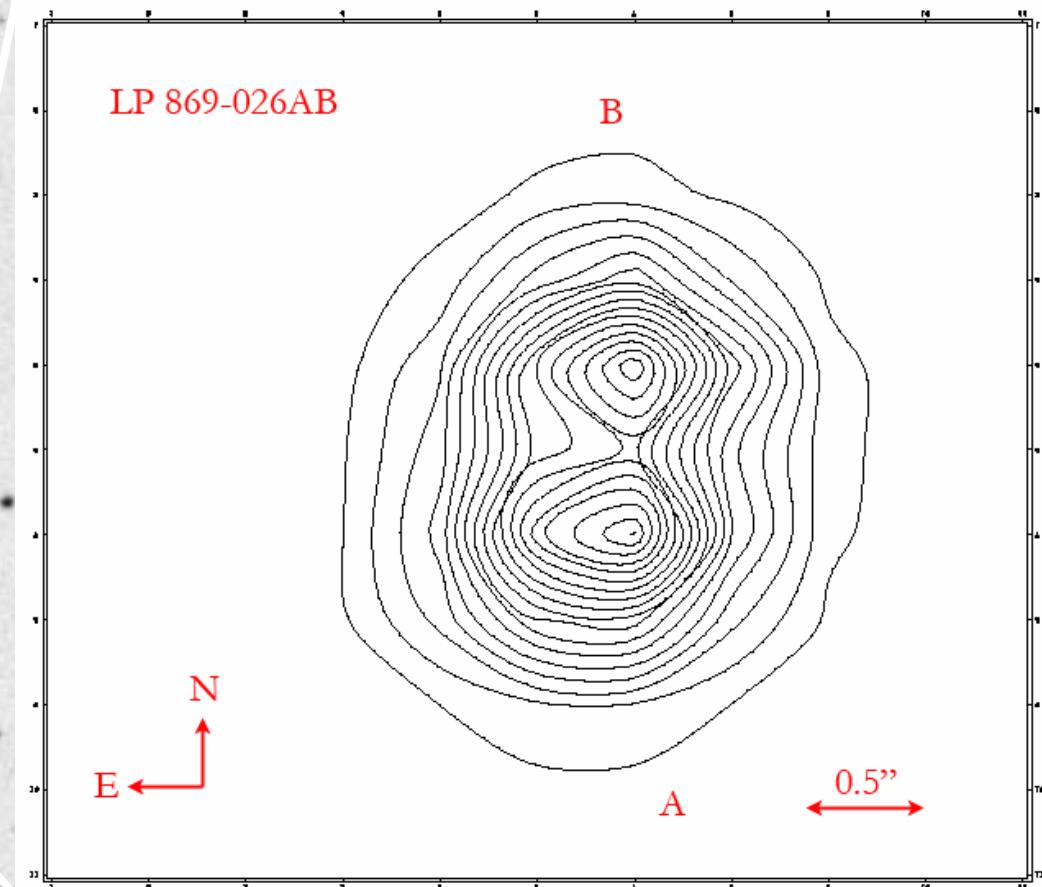

*Reid, Kilkenny, & Cruz 2002

10"×10"

N

E

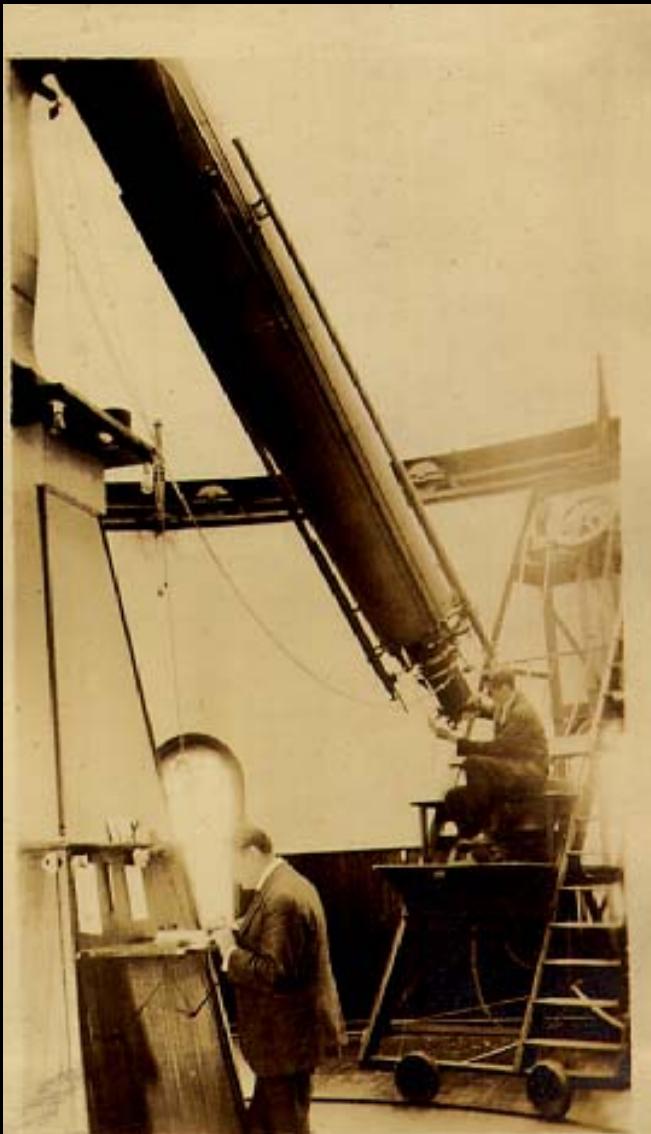

LP 869-26

~35% Multiples

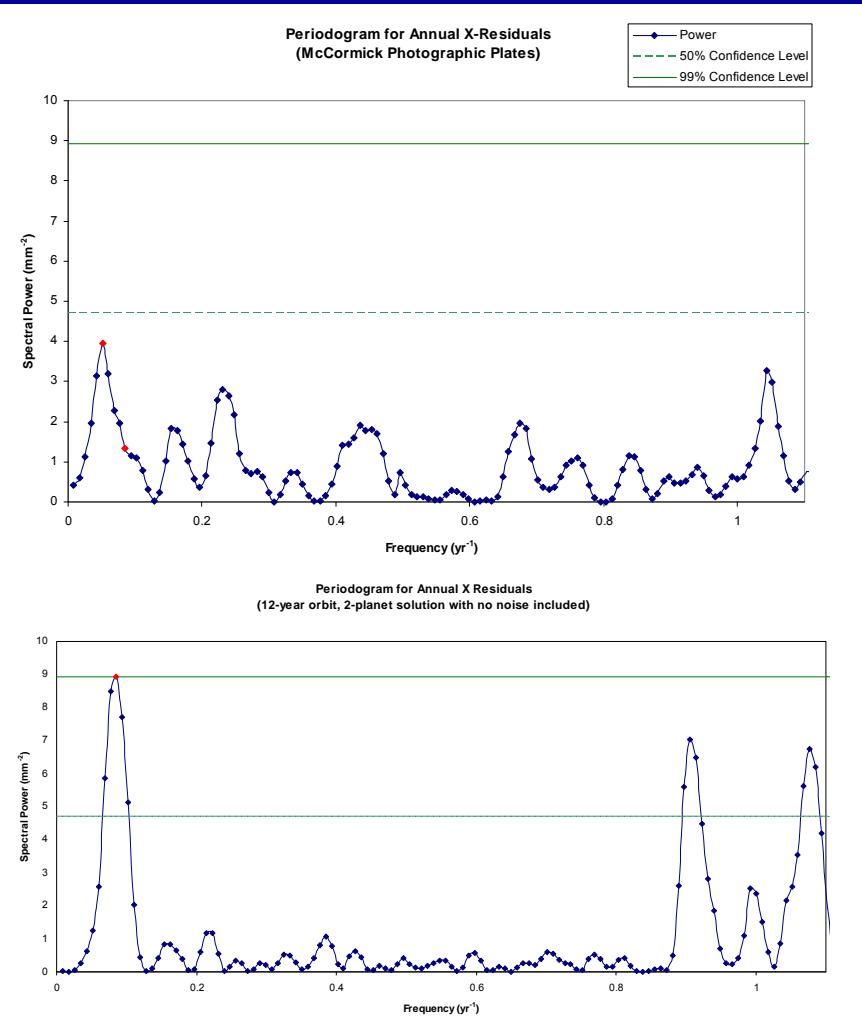

- LP 869-26 newly resolved
- 5 parallactic distances > 2x previous estimates
- 5 previously identified pairs

Barnard's Star at LMO

- ❖ 1963—1986, van de Kamp describes detection
 - 2 planets < $1 M_{\oplus}$
 - $P_i = 12$ yrs, $P_o = 20$ yrs
 - Unconfirmed
- ❖ Leander McCormick Obs
 - 26.25" Alvan Clark refractor
 - 2nd largest collection of Barnard's Star plates
 - ✓ 919 photographic plates
 - ✓ 1969 through 1998

Barnard's Star

- ❖ Relative Parallax
 $0.547 \pm 0.001''$
- ❖ Proper Motion
 $10.354 \pm 0.006''/\text{yr}$
 $355.905 \pm 0.001^\circ$
- ❖ Secular acceleration
 $0.00125 \pm 0.00004''/\text{yr}^2$
- ❖ Upper limit planet
 $2.2 \pm 0.5 M_{\oplus}$

UVa Southern Parallax Program

❖ Siding Spring Observatory, Australia

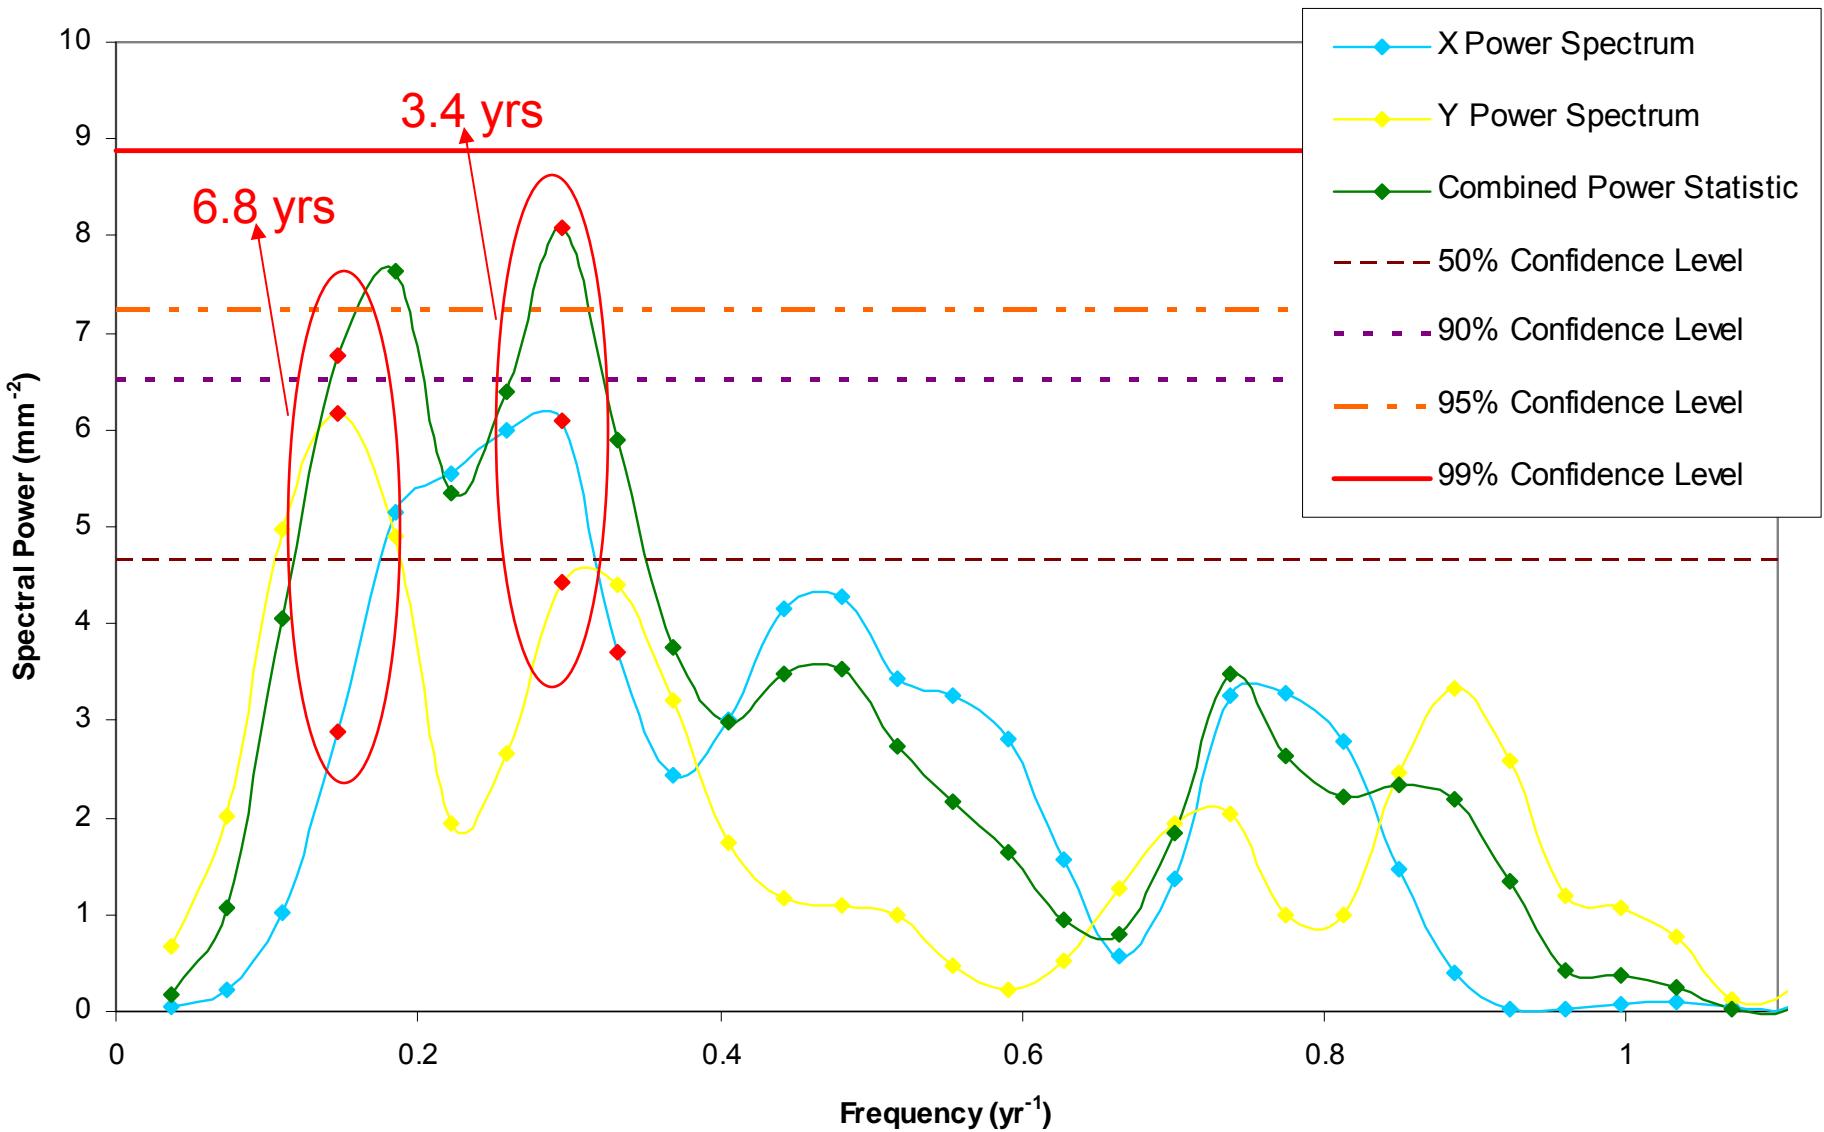

- 40" telescope
- Observed 1987-2002

❖ 90 possible nearby stars

- 13 stars selected for further analysis
 - All with 25 pc , closest LHS 1565 at $3.51 \pm 0.02 \text{ pc}$
 - Spectral types M0.5V—M5.5V + LHS 34 (WD)
 - Brightness $V_J 11.4\text{--}14 \text{ mag}$
- 12 stars without significant perturbation
 - LHS 3242 nothing $\geq 18 \pm 1 M_{\odot}$ (brown dwarf)
 - LHS 1565 nothing $\geq 1.7 \pm 0.4 M_{\odot}$ (gas giant)

LHS 288

Periodograms for LHS 288 Nightly Residuals

Solar Neighborhood Updates

❖ Parallaxes

- ✓ 31 possible nearby stars under investigation
 - ✓ Preliminary parallaxes, proper motions
 - ✓ Preliminary photometry, spectroscopy
- ✓ 28 probable nearby stars, 3 within 10 pc
- ✓ 1 possible new binary resolved

❖ Planet Search Limits

- ✓ Barnard's Star nothing $\geq 2.2 M_{\oplus}$
- ✓ 12 SPP nothing detected
- ✓ LHS 288, possible companion $\geq 2.4 M_{\oplus}$

Abstract

Although the stars within 25 pc of the Sun constitute the one stellar sample that we can aspire to know thoroughly, we continue identifying objects closer than 10 pc. We know even less about local substellar populations, especially planets. The Cerro Tololo Inter-American Observatory Parallax Investigation (CTIOPI) is observing 31 late-type, red dwarfs selected for my thesis as part of a larger effort to complete the nearby star census. Preliminary parallaxes substantiate distances less than 25 pc for at least 28 stars. Of these, LP 991-84, LHS 6167, and LP 876-10 may lie within 10 pc. Preliminary proper motions for all but three stars exceed $0.2'' \text{ yr}^{-1}$. One recently established neighbor, LP 869-26, also appears to be a new binary. Associated /VRI/ photometry and spectroscopy are in progress as well. Many of these stars are potential targets for astrometric planet searches, such as the Space Interferometry Mission (SIM).

In addition to confirming solar neighborhood membership, astrometry can discover brown dwarfs and planets. Time-series analyses of residuals to the UVa Southern Parallax Program (SPP) observations are contributing to frequency and distribution data for nearby substellar objects. In particular, LHS 288 displays an intriguing signal, which might be caused by a very low-mass companion. Twelve other SPP stars demonstrate no significant perturbations.

Finally, re-analyzing the Leander McCormick Observatory photographic plates of Barnard's Star failed to detect any planets orbiting it. This study of more than 900 exposures was sensitive to bodies of 2.2 Jupiter masses or more.

NSF grants AST 98-20711 and 05-07711, GSU, NASA-SIM, Litton Marine Systems, UVa, Hampden-Sydney College, US Naval Observatory, and the Levinson Fund of the Peninsula Community Foundation supported this research. The ANU Research School of Astronomy & Astrophysics allocated observing time generously. CTIOPI was an NOAO Survey Program and continues as part of the SMARTS Consortium.
